

Scientific Proof: Blood Microscopy Case Study

Dr. Thomas Brewer, PhD, conducted a live blood analysis to demonstrate the effects of Qi Coil frequency therapy.

Before Treatment

Pre-Treatment Analysis

Before treatment, the blood was described as thick and sticky, with little movement. Red blood cells appeared clumped and irregular, indicating poor oxygenation and circulation.

Observed Effects: Low energy, brain fog and physical exhaustion.

Post-Treatment Analysis

After the session, the red blood cells were described as round, separated and moving freely, showing greater vitality and a marked improvement in blood flow.

Observed Effects: Higher energy levels, clearer thinking and renewed vitality.

Case Study: Dr. Wilcox (Age 65+)

Condition: Dr. Wilcox experienced chronic fatigue, ongoing tiredness and sleepiness. Blood microscopy showed sluggish, coagulated blood, associated with poor circulation and low cellular energy.

Protocol: The Qi Coil System was used with the Sluggish Blood Rife Frequency setting for four 3-minute sessions, lasting 12 minutes in total.

Key Takeaway: The case study describes how 12 minutes of targeted Qi Coil frequency therapy changed sluggish blood, supporting healthier circulation and an immediate increase in energy.
